

## Diagnosing Needs

In determining the electrical needs of any office project, the primary goal should be safely providing power without potentially causing damage to electronic equipment, and providing electrical systems that are portable.

As a rule of thumb, when specifying power and communications components for freestanding workstations there are a number of basic variables to consider that will help you determine the best selection of components for both short and long term end-user needs.

Consider the following:

1. What is the nature of the end-user's industry and how often does the end-user move employees? Does it have high churn rates or is it relatively stable? This will help determine how flexible and mobile the electrical systems that support the client's business should be.
2. What is the primary function(s) of the end-user's business? What is the extent to which each employee needs to be "wired?"
3. Does it rely on extensive electronics and communications devices? Do employees work independently from traditional offices and/or cubicles or are project teams and group spaces also employed regularly?
4. Does the client rely on a local area network (LAN) set-up or is the office space hardwired to accommodate individual data and communication needs? Or somewhere in between? This will determine factors such as how much cabling will be needed, and how many networked. Some experts believe that since the costs for cabling will keep increasing, designers and facility managers should consider specifying now for future needs. At this time, the average cable need is two cable lines per person. Is the current infrastructure capable of handling electronics and electrical needs? This and the end-user's plans for electronic usage will help determine how much outside technical assistance from an electrician or other personnel will be needed. It will also help you determine how many hardwired components you need and where corded components can be used.
5. What are the electrical codes? Codes vary by locations. Contact a qualified electrical contractor or engineer about local requirements.
6. Does the client want power sources above, hidden below, or level with the workstation level? This will help indicate where outlets will need to be installed, and how flexible the workstation design can be.

## Electrical Basics

Understanding electrical needs is the start of the process in determining the kind of user and the level of sophistication their needs require. Currently, solutions to creating the necessary outlets for electronics and data systems range from power strips to having an electrician hardwire an entire workspace for the necessary outlets. But when is the power strip a logical solution? When is the cost of an electrician unnecessary? To help shed more light on the topic of specifying electrical systems for today's workstations, here are some basic office and typical home office needs.

**Individual small office/home office user** - electronics may include one computer, monitor, printer, one or two computer accessories and telephone.

Electrical system needs: five outlets (additional outlets required for lamp, clock, radio and other accessories).

Data/communications requirements: one phone jack for computer modem, one for telephone and possibly a fax machine.

## Cordset Components

Retractable Power Centers, Power/Data Centers, Power/Communications Grommets, Power Grommet, Worksurface Power, Tri-Power Electrical/Data Strip

The selection of cordset components provides an easy-to-specify and easy-to-install power/communications system. Cordset components can provide power outlets and voice/data jacks at the worksurface level.

Specifications	15-amp grounded outlets. These components should not be linked or "daisy-chained" in a series.
Application	Use where power or power/communications access is needed at surface level
Power	Plugged into facility's electrical system.

## Communications:

Items with Data/Communications provide combinations of RJ11 Communication Category 3 couplers and/or RJ45 Category 5E Data Jacks. RJ11 Couplers are 6-pin female-female connectors that allow the user to connect 2 telephone lines together. RJ45 Jacks are 8-pin Category 5 Enhanced for high-speed data transmission and are "hardwired" to twisted-pair data communication cables.

## Power/Communications Access

For power and communications at worksurface level

Power Grommet

Power/Communications Grommet

For power and communications below worksurfaces

Tri-Power Electrical/Data Strip

## Configurations

Many Power and Communication/Data configurations are available.

Call for your special application needs.

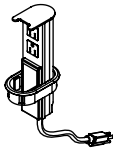

## Code Requirements

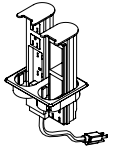

Electrical codes vary by location. Specifiers should contact a qualified electrical contractor or engineer about local requirements.

**Components meet the latest edition of the National Electric Code. Components are listed by Underwriters Laboratories and certified by the Canadian Standard Association.**

## Optional Electrical Cutout for Conference Tables:

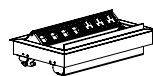

\$100 Retail Upcharge per Electrical Cutout - Specify and price Electrical Components separately. Submit drawing with the Conference Table order specifying location, size and type of electrical cutout(s).

Description / Model	List Price	Ship wt / cubes
Retractable Power Center		
<b>P-EC1000RPB</b>	\$ 300	4 / .5
<b>P-EC1000RPS</b>	\$ 300	4 / .5
	P-EC1000RPB - Black, P-EC1000RPS - Silver (2) 15-amp electrical outlets (1) RJ11 coupler (1) RJ45 Cat 5E jack 10' cord with 15-amp plug Voice/data adapter kit will accept jacks from most manufacturers Field installed, retrofits into oval grommet	<b>W</b> 2 <sup>5</sup> / <sub>8</sub> <b>D</b> 4 <sup>1</sup> / <sub>4</sub> <b>H</b> 8 <sup>5</sup> / <sub>8</sub>  Not recommended for use with Bases from Fuse Caseloads Series

Double Retractable Power Center		
<b>P-EC2000RP</b>	\$ 445	4 / .5
	(4) 15-amp circuit breaker protected electrical outlets (1) RJ11 coupler (3) RJ45 Cat 5E jack 10' cord with 15-amp plug Voice/data adapter kit will accept jacks from most manufacturers Grommet included - field installed Black only	<b>W</b> 5 <sup>3</sup> / <sub>8</sub> <b>D</b> 4 <sup>1</sup> / <sub>4</sub> <b>H</b> 8 <sup>1</sup> / <sub>8</sub>  Not recommended for use with Bases from Fuse Caseloads Series
